10 BACKGROUND ART

[0002] Many condensed pyridazine derivatives are currently synthesized as drugs for a variety of diseases. For example, USP 3,915,968 discloses a compound represented by the formula:

wherein R and R³ independently represent a hydrogen atom or a lower alkyl group (at least one of R and R³ is a lower alkyl group); R¹ and R² represent a heterocyclic group selected from the group consisting of pyrrolidine, piperidine, piperazine and morpholine taken together with the adjacent nitrogen atom; or a salt thereof. USA 4,136,182 discloses that a compound represented by the formula:

wherein R represents a hydrogen atom, a phenyl group or a lower alkylcarbonylamino group; R¹ represents morpholino or piperidino; R² represents a hydrogen atom or a lower alkyl group (at least one of R and R² is a group other than a hydrogen atom; when R is a phenyl group, R¹ is morpholino and R² is a lower alkyl group); or a salt thereof, is useful as a bronchodilator for mitigating bronchial spasms.

40 **[0003]** Also, Japanese Patent Unexamined Publication No. 279447/1995 discloses that a compound represented by the formula:

wherein R¹ represents a hydrogen atom, a lower alkyl group that may be substituted, or a halogen atom; R² and R³ independently represent a hydrogen atom or a lower alkyl group which may be substituted, or may form a 5- to 7-membered ring with the adjacent -C=C-; X represents an oxygen atom or S(O)_p (p represents an integer of 0 to 2); Y represents a group represented by the formula:

(R⁴ and R⁵ independently represent a hydrogen atom or a lower alkyl group which may be substituted) or a divalent group derived from a 3- to 7-membered homocycle or heterocycle which may be substituted; R⁶ and R⁷ independently represent a hydrogen atom, a lower alkyl group which may be substituted, a cycloalkyl group which may be substituted, or an aryl group that may be substituted, or may form a nitrogen-containing heterocyclic group which may be substituted, with the adjacent nitrogen atom; m represents an integer from 0 to 4, and n represents an integer from 0 to 4; or a salt thereof; and, as an example synthetic product, a compound of the formula:

exhibits anti-asthmatic, anti-PAF, anti-inflammatory and anti-allergic activities.

[0004] Furthermore, Japanese Patent Unexamined Publication No. 279446/1995 describes a compound represented by the formula:

wherein R¹ represents a hydrogen atom, a lower alkyl group which may be substituted, or a halogen atom; R² and R³ independently represent a hydrogen atom or a lower alkyl group which may be substituted (provided that either of R² and R³ is a hydrogen atom, the other represents a lower alkyl group which may be substituted), or may form a 5- to 7-membered ring taken together with the adjacent -C=C-; X represents an oxygen atom or S(O)_p (p represents an integer of 0 to 2); Y represents a group represented by the formula:

(R⁴ and R⁵ independently represent a hydrogen atom or a lower alkyl group which may be substituted) or a divalent group derived from a 3- to 7-membered homocycle or heterocycle which may be substituted; R⁶ and R⁷ independently represent a hydrogen atom, a lower alkyl group which may be substituted, a cycloalkyl group which may be substituted, or an aryl group which may be substituted, or may form a nitrogen-containing heterocyclic group which may be sub-

stituted, taken together with the adjacent nitrogen atom; m represents an integer from 0 to 4, and n represents an integer from 0 to 4; or a salt thereof; and discloses that these compounds possess anti-allergic, anti-inflammatory and anti-PAF (platelet activating factor) activities to suppress bronchial spasms and bronchial contraction, therefore could be utilized as effective anti-asthmatic agents.

[0005] On the other hand, as compounds exhibiting anti-allergic or anti-histaminic activities, there may be mentioned, for example, terfenadine (The Merck Index, 12th edition, 9307) and ebastine (The Merck Index, 12th edition, 3534), which are already in clinical use.

[0006] And, EP128536 discloses anti-bacterial compounds represented by the formula:

Experimental Example 1A

Effect on histamine-induced skin reactions in guinea pigs

[0423] Male Hartley guinea pigs weighing about 500 g were used. After the dorsal hair was shaved under ether anesthesia, 1 ml of a 2.5% pontamine sky blue solution was injected intravenously administered, and then 0.1 ml of histamine at 3 μ g/ml was injected intradermally into 2 sites (left and right) in the back. Thirty minutes after the injection of histamine, animals were killed by bleeding and the skin was removed. Two perpendicular diameters (mm) of each blue spot on the inside of the skin were measured and multiplied; the mean for the two products was taken as the microvascular permeability index. Test compounds were suspended in a 5% gum arabic solution and orally administered in a volume of 0.2 ml/100 g body weight 1 hour before histamine administration. Animals in the control group received the same volume of a 5% gum arabic solution. The suppression rate of the sample for the title reaction was calculated using Equation 1.

Equation 1

$$\text{Inhibition (\%)} \text{ of histamine-induced skin reactions} = 100$$

$$\times \left(1 - \frac{\text{vascular permeability index in the presence of}}{\text{drug/vascular permeability index in control group}} \right)$$

[0424] The results are given in Table 1.

Experimental Example 2A

1) Preparation of guinea pig eosinophils

[0425] To male Hartley guinea pigs, 2 ml of equine serum (Bio-Whittaker, Inc.) was intraperitoneally administered once weekly for 8 consecutive weeks. At 48 hours after final administration, 75 ml of physiological saline was intraperitoneally injected, after which the saline was recovered and centrifuged at 400 \times g for 5 minutes. The resulting sediment was suspended in 5 ml of Percoll solution (density (d) = 1.07) and layered on top of the multiple layers of different densities of Percoll solution (density(d) = 1.112, 5 ml; d = 1.095, 10 ml; d = 1.090, 10 ml; d = 1.085, 5 ml), followed by centrifugation at 1,000 \times g for 25 minutes (20°C). The cell layer formed at the interface between densities 1.112 and 1.095 was collected. Erythrocytes present in the collected cell sediment were removed by hypotonic treatment (suspended in water for 30 seconds).

[0426] The cell sediment was washed 3 times with Hanks' solution containing 10 mM Hepes (Dojin Kagaku) (Hanks-Hepes) and suspended in a Hanks-Hepes solution containing 2% human serum albumin (Wako Pure Chemical Industry or Sigma) (Hanks-Hepes-HSA) to a final concentration of 5.56×10^6 cells/ml. Eosinophil purity was 90%, viability being over 98%.

2) Determination of chemotactic reaction suppression

[0427] To a 24-well petri dish, which serves as a lower chamber, 600 μ l of Hanks-Hepes-HSA solution containing LTB₄ (final concentration 10⁻⁸ M, Cascade Biochemical Ltd.), was transferred, followed by incubation at 37°C for 30 minutes in a carbon dioxide incubator. Separately, 200 μ l of eosinophil suspension (5 \times 10⁶ cells/ml), previously incubated at 37°C for 15 minutes, was added to Chemotaxicell (polycarbonate membrane, pore size 3 μ m, thickness 10 μ m), which serves as an upper chamber, after the upper chamber was attached to the 24-well petri dish. After 2 hours of reaction in the CO₂ incubator, the Chemotaxicell was removed; 60 μ l of a 2% (w/v) solution of EDTA in physiological saline was added to the liquid in the lower chamber. After the mixture was on cooled ice, the cells migrating into the lower chamber were counted using a blood cell counter [Coulter Counter (trade name)]. The test drug, dissolved in N,N-dimethyl formamide (DMF), was added to both the upper and lower chambers to a final concentration of 10⁻⁵ M.

Equation 2

$$\text{Chemotactic reaction suppression rate} = [1 - (\text{number of migrating cells in the presence of drug} / \text{number of migrating cells in the absence of drug})] \times 100$$

suppression rates of LTB₄-induced chemotactic reaction by test substances (1 \times 10⁻⁵ M) were calculated using the above equation. The results are shown in Table 2.

Method A

Step A: Ethyl 6-chloroimidazo[1,2-b]pyridazine-2-acetate

[0449] After 11.2 g of 3-amino-6-chloropyridazine was suspended in 150 mL of ethanol, 28.6 g of ethyl 4-chloroacetoacetate was added thereto and heated under reflux for 24 hours. After cooling, the mixture was concentrated under reduced pressure and the residue was adjusted to pH 7 by the addition of an aqueous sodium hydrogencarbonate solution and extracted with ethyl acetate. The extract was washed with a saline solution and dried over magnesium sulfate. After concentration under reduced pressure, the residue was subjected to silica gel chromatography to be eluted with hexane:ethyl acetate (2:3). The desired fraction was collected to provide 12.7 g of the title compound.

To the mixture was added 4.36 mL of methyl iodide while cooling in ice-cold water, and thereafter stirred at room temperature for 2 hours. To the mixture was poured ice-cold water, and then extracted with ethyl acetate. The extract is washed with a saline solution, dried over magnesium sulfate, and concentrated under reduced pressure. The residue was subjected to silica gel chromatography to be eluted with hexane:ethyl acetate (2:1). The desired fraction was collected and concentrated to provide 4.06 g of the title compound.

After the dorsal hair was shaved under ether anesthesia, 1 ml of a 2.5% pontamine sky blue solution was injected intravenously administered, and then 0.1 ml of histamine at 3 µg/ml was injected intradermally into 2 sites (left and right) in the back. Thirty minutes after the injection of histamine, animals were killed by bleeding and the skin was removed. Two perpendicular diameters (mm) of each blue spot on the inside of the skin were measured and multiplied; the mean for the two products was taken as the microvascular permeability index. Test compounds were suspended in a 5% gum arabic solution and orally administered in a volume of 0.2 ml/100 g body weight 1 hour before histamine administration. Animals in the control group received the same volume of a 5% gum arabic solution. The suppression rate of the sample for the title reaction was calculated using Equation 1.

Equation 1

Inhibition (%) of histamine-induced skin reactions = 100

$\times (1 - \frac{\text{vascular permeability index in the presence of drug}}{\text{vascular permeability index in control group}})$

[0475] The results are given in Table 3.

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 8-9, 36-38
because they relate to subject matter not required to be searched by this Authority, namely:

The subject matter of claims 8-9 and 36-38 relates to a method for treatment of the human body by therapy.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

- Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
